CASE STUDY 2: CLINIC AND SCHOOL PARTNERSHIP OPPORTUNITIES TO INCREASE MMR COVERAGE

Emily is an immunization coordinator for a pediatric clinic in the Forest Lake Area of Washington County. A neighboring county has recently had several measles cases. Emily would like to partner with local schools in Forest Lake to increase MMR coverage among school-age children. She would like to target her outreach efforts to the schools with the lowest coverage, as time and resources are limited.

Emily uses the *Midwest EpiView: MMR Coverage and Measles* dashboard to review MMR vaccination coverage for the schools near Forest Lake. While overall coverage is relatively high, she notes a cluster of schools with lower MMR coverage. Emily would like to connect with local school officials and see what partnership opportunities are available to increase MMR coverage.

Using this information, Emily decides to begin her outreach with schools in the area with less than 85% of students fully vaccinated for MMR. She works with local public health to explore partnership opportunities with these schools.

Using these findings, Emily works with local public health and school officials to:

- Identify students without documented MMR vaccination for follow-up
- Communicate with families about measles risk, symptoms, and vaccination recommendations
- Facilitate on-site or referral-based vaccination opportunities
- Review school-level vaccination data and policies to inform future preparedness

Public Health Impact: By using school-level data, Emily can respond quickly and appropriately with a goal of increasing MMR coverage among students. The dashboard supports informed decision-making, data driven insights, and proactive steps to target outreach efforts where they would have the biggest impact.
