CASE STUDY 3: PRESENTING A MEASLES OUTREACH PLAN TO A COUNTY BOARD

Dan is a public health staff member at a local health department preparing to present to his county board about measles risk and prevention. With recent outbreaks occurring in neighboring states, county leadership has asked for an update on local vulnerability to prioritize limited public health resources. Dan needs to clearly communicate three things: how measles has impacted the region historically, the current state of MMR vaccination coverage in local schools and child care centers, and where outreach would have the greatest impact.

Measles Cases by Year and Age Group: County of Hennepin

County	Year	0–4 Years	5–11 Years	12–19 Years	20–49 Years	50+ Years	Unknown
Hennepin	2010	0	0	0	2	0	0
Hennepin	2011	18	1	0	2	1	0
Hennepin	2013	1	0	0	0	1	0
Hennepin	2014	1	0	0	0	0	0
Hennepin	2015	1	0	0	1	0	0
Hennepin	2016	0	2	0	0	0	0
Hennepin	2017	52	10	0	3	1	0
Hennepin	2018	0	1	0	0	0	0
Hennepin	2022	6	5	0	0	0	0
Hennepin	2024	27	18	3	1	0	0
Hennepin	2025	1	1	0	1	0	0

Dan begins by using the *Midwest EpiView: MMR Coverage and Measles* dashboard to explore historical measles case data to understand past patterns of disease in his county. He then shifts to current MMR vaccination coverage, using the dashboard to assess variation across schools and child care centers. While overall coverage appears high, Dan identifies several facilities below the 95% threshold needed to prevent sustained transmission. Using the proximity map and summary figures, Dan highlights clusters of school and child cares with low MMR coverage.

Using these insights, Dan develops a set of recommendations for the county board:

- Prioritize outreach and vaccination efforts in schools and child care centers with the lowest coverage
- Support local vaccination clinics in areas with identified gaps in immunity
- Strengthen communication strategies to address vaccine hesitancy and exemptions
- Monitor under-vaccinated clusters of schools and child cares as part of ongoing preparedness efforts

Public Health Impact: By combining historical case data with current vaccination coverage, Dan can present a clear and data-driven picture of how measles has historically impacted the county and where pockets of risk currently exist. This approach helps county leadership understand both the potential for future outbreaks and where targeted interventions can be most effective, supporting more informed decision-making and efficient use of public health resources.
